

Welcome to the torbo newsletter with the edition 02/2010!

In the current newsletter you will find important Datas & Facts, more informationen about torbo and the technology of wet sandblasting. Enjoy your reading. The torbo team will be happy to hear from you - via e-mail, fax or phone call - should you have any questions or suggestions about your special applications!!

Oil tank blasting with the torbo-system

The company CETIN, a constructor of oil tanks with their head quarter in Mesin / Turkey has got the order from the oil company

Image 1: oil tank before / after

DELTA, to build 11 new tanks and renovate 5 old tanks. At the new thanks they had to blast the weldings and the used tanks the old paint had to be removed. The oil company, DELTA, pointed out that around the plant is a living area so no dry blasting is allowed. And for that reason the decision felt for torbo because with our torbo-system is the dust development very low. Further advantage is they can blast one tank and at the same time it is possible to paint the tank next to it. For this project two torbo-machines XL320-S where used with 11m³ / min-compressor.

New shine for Europe`s biggest monument - Völkerschlachtdenkmal - „Monument to the battle of the nations-

Das Völkerschlachtdenkmal („Monument to the battle of the nations“) in Leipzig, Germany is considered to be Europe`s biggest monument.

The construction required a total of 120,000 m³ of tamped concrete and 12,500 m³ porphyroid granite. The monument was inaugurated in 1913 on the occasion of the 100th anniversary of the decisive battle of the Allied Forces against Napoleon`s army. Over 120,000 people paid for this battle with her life. The imposing 90-metre-high-monument got over the first and second world war.

Image 3: Völkerschlachtdenkmal („Monument to the battle of the nations“)

Image 4: blasting work at the monument

But the monument suffered very strong under the weather and now it looks out like a very glommy and almost dark monument. From there the monument is currently being restored. The aim is to have it shining in the same splendour on it`s 100th anniversary as it`s opening in 1913. Especially for historic structures, preservation of the structural fabric and gentle cleaning without loss of material is top priority but the environmental protection was not ignored during the cleaning either.

A number of sand blasting systems were tested in advance. The decision was ultimately in favour of torbo. There won`t be any losers when it comes to the restoration of the „Völkerschlachtdenkmal“ in Leipzig. The winners include not only the new (old) monument and the people of Leipzig, but also all fans of historic architecture.

Asbestos removal in the United Kingdom

torbo was manufactured in Germany for over 25 years and torbo is world leading in the area for wet abrasive blasting system. In partnership with our agents (agents in over 40 countries worldwide) torbo offers the complete solution for eco-friendly and efficient asbestos removal:

- Superior product
- Premium Service
- Unrivalled technical and after-sales support

The clean, safe and efficient solution to your asbestos removal needs.

The company Silverdell (UK) have selected to use the torbo machines L200 and L320 to remove asbestos as part of the refurbishment of Shell Tower in Central London.

Image 6: asbestos removal with torbo Central London.

„The torbo-system have enabled improved productivity due to the efficiency of the machine driving faster asbestos removal rates. The increased capacity of the large vessels means less down-time whilst the systems are compact, flexible and more mobile. This is ideal for the working environment in the Shell Tower“ Terry Cross, Operations Director, Silverdell (UK) commented.

In addition, the torbo-system has enabled us to significantly improve the quality of the working environmental in the enclosure whilst still maintaining the prescribed conditions for safe asbestos removal activities.
